

MEMO

TO: Chairman / Academic Syndicate

THROUGH: CS Coordinator

FROM: Group Project-1 Coordinator

SUBJECT: Student Group Creation, Evaluation Criteria and Examiners of SCS2202 / IS2102:
Group Project 1 - 2024

DATE: 2024 – 07 – 17

- The Refined Evaluation Criteria of the SCS2202 / IS2102: Group Project 1 – 2024 is defined as follows:

Final Individual Grade = Group Grade + Individual Grade

Group Grade Calculation (80%)

1. 0% - Project Proposal Defence

- 1.1. Students should submit a proposal report and do a 15-minute presentation followed by a 5-minute viva to defend the project idea.
- 1.2. The examiner's recommendation of acceptance should be obtained to proceed further.
- 1.3. If the examiners reject the project idea,
 - 1.3.1. Students should submit a different or refined version of the previous project idea within a week of the proposal defence.

2. 0% - Interim Defense

- 2.1. Students should do a 15-minute presentation and demonstration and a 15-minute viva to evaluate the project's progress.
 - 2.1.1. It should include all the finalised implemented UIs of the system, UML diagrams, the authentication module, and four CRUD operations for each student.

- 2.2. If the progress is unsatisfactory, examiners can impose a **10% penalty** on the final grade to maintain the students' progress.
- 3. **80% - Final Defense** - Presentation and demonstration of the fully completed working system.
 - 3.1. Students should submit a document with each member's test cases and individual contributions and do a 20-minute presentation and demonstration, followed by a 10-minute viva.
 - 3.2. If the student group does not score at least 25% on the final defence, they will fail to earn the module's pass mark of 40.

Individual Grade Calculation (20%)

- 1. **5% - Supervisor Recommendation**
 - 1.1. Either the group supervisor or co-supervisor can give the mark to push the student's grade to the next grade.
- 2. **15% - Individual Contribution**
 - 2.1. One code checker will assigned to the whole group to better understand the work distribution among the group.
 - 2.2. The code-checker will review the system's codebase to examine each individual contribution.
 - 2.3. The code review will take 30 minutes per student.
- 3. **Task completion** - (Adjustment factor; no direct mark)
 - 3.1. The code-checker will ask for a code explanation and give two tasks to the student.
 - 3.2. Only 1 hour will be allocated.
 - 3.3. Each student's **group mark** will be adjusted as follows;
 - 3.3.1. Code explanation - (Poor, Average, Good) (**10%** weight).
 - 3.3.2. Task 1 completion - (**60%** weight).
 - 3.3.2.1. Frontend completion - 5%
 - 3.3.2.2. Backend completion - 5%

3.3.2.3. DB change completion - 5%

3.3.2.4. Task completion - 45%

3.3.3. Task 2 completion - (Yes/No) (**30%** weight).

3.4. Tasks behaviour

3.4.1. Task 1: Simple CRUD operation without any business logic. (For example, data from the front end can be inserted into the DB.)

3.4.1.1. Task 1 is based on Frontend, Backend and DB changes.

3.4.2. Task 2: Implement business logic. (For example, data from the front end can be inserted into the DB based on a specific business logic.)

3.4.2.1. Task 2 should be an extension of Task 1.

Process Refinements:

- a. The code checker will fill out a Google form at the end of the code check.
- b. The student should submit the evidence to the VLE at the end of the code check.
- c. Students should check the status of the code check and sign at the end of the code check as they acknowledge.
- d. Course instructors should check the (a),(b), and (c) before each student leaves the area.
- e. If the student fails to complete Task 1 **fully**, the course coordinator should assign another task from the Task 1 category and give a 40% mark for the completion. (No Task 2 will be provided from the repeat panel)
- f. The status of the repeat panel will be updated in (c), and the student should sign again regarding the status of the repeat panel.
